### **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
  - 1. Determining the scope and contents of the prior art.
  - 2. Ascertaining the differences between the prior art and the claims at issue.
  - 3. Resolving the level of ordinary skill in the pertinent art.
  - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 3. Claims 1-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over applicant's admitted prior art (AAPA) in view of Park et al., (Park), US 2004/0032385.
- 4. The AAPA discloses and shows in Fig. 3, a field-sequential liquid crystal display panel, comprising:
  - thin film transistors (332);
  - cell electrodes (E11R -----E31B) respectively coupled to the drains of the thin film transistors;
  - scan electrode lines (LS1-----LSn) coupled to the gates of the thin film transistors;

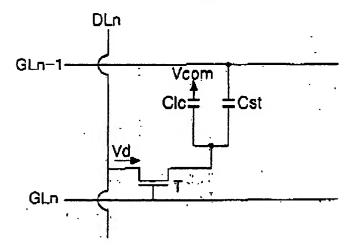

Art Unit: 2871

 data electrode lines (LD1-----LD3) coupled to the sources of the thin film transistors; and

- storage capacitors (C11R --- C31B).

The AAPA described in the instant application differs from the claimed invention because he does not explicitly disclose that the storage capacitors are provided between the cell electrodes and a respective one of the scan electrode lines.

FIG.3
RELATED ART

Park discloses a liquid crystal display panel having pixel electrode (applicant's cell electrode), scan electrode lines (Gln, Gln-1) and storage capacitors (Cst) formed between the cell electrode and the previous scan electrode lines. He also discloses that such an arrangement implements gray levels (page 1, [0013]).

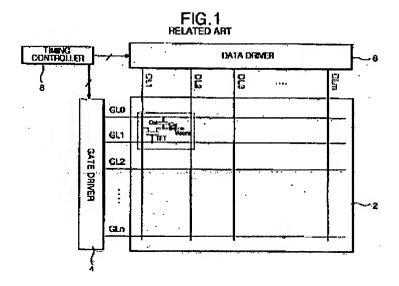

Park is evidence that ordinary workers in the art would find a reason, suggestion or motivation to form the storage capacitors between the cell electrodes and the scan electrode lines.

Application/Control Number: 10/796,027

Art Unit: 2871

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the display panel of the AAPA by placing the storage capacitors between the cell electrodes and the scan electrode lines to implement gray levels.

Accordingly, claims 1 and 8 would have been obvious.

As to claims 2, 3, 5, 9 and 10, Park also shows in Figs 1 and 3 that the storage capacitors (Cst) are each provided between one of the cell electrodes and one of the scan electrode lines (GLn-1 for Fig. 3) that is adjacent to a scan electrode line coupled to the respective one cell electrode through one of the thin film transistors (TFT) and that the adjacent scan electrode line (Gln-1) and the scan electrode line (Gl1)coupled to the respective one cell electrode are provided at opposite sides of the respective cell electrode.

As to claims 4 and 7, the AAPA also shows in Fig. 3 that display panel also comprising a data driver (55) and a scan driver (54) to drive the data electrode lines and the scan electrode lines respectively.

As to claims 6 and 11, the AAPA described in the instant application discloses the capacitance to be 0.06 PF (which is very close to *approximately* 0.07 PF). Further, considering that the AAPA does not explicitly disclose that the capacitance of the storage capacitor is approximately 0.07 PF to 0.2 PF, it is common and known in the art to set the capacitance of the storage capacitor within the claimed range to optimize the performance of the display panel and thus would have been obvious.

As to claim 12, the AAPA described in the instant application also discloses (page 3, paragraph 0014) that the voltage is sustained in the storage capacitors between an ending point of scanning each of the respective scan electrode lines and a starting point of a lighting time which is applied to ones of the cell electrodes.

As to claims 13-14, the AAPA also discloses and shows in Fig. 5 that the display panel further comprising a glass substrate (51), wherein the scan electrode lines are provided on the glass substrate and an insulating layer provided on the data electrode lines and wherein the cell electrodes are formed on the insulating layer (page 4, paragraph 0015).

As to claim 15, it is also clear from Fig. 4 of the AAPA that the storage capacitors are formed by arranging the cell electrodes so that upper portions of the cell electrodes are disposed under the scan electrode lines.

## Response to Arguments

5. Applicant's arguments with respect to claims have been considered but are moot in view of the new ground(s) of rejection.

#### Conclusion

- 6. The prior arts made of record and not relied upon are considered pertinent to applicant's disclosure. Specifically, Applicant's attention is respectfully requested to the following cited prior arts.
  - a) US 2003/0063074 (Fig.1) and
  - b) US 2004/0160554 (Fig. 15)

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tarifur R. Chowdhury whose telephone number is (571) 272-2287. The examiner can normally be reached on M-Th (6:30-5:00) Friday Off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Robert Kim can be reached on (571) 272-2293. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
